Preface

Nanorobotics and nanodiagnostics are the emerging tools in the history of nanotechnology to combat several animal and plant diseases. Nanorobots or nanobots of approximately 50–100 nm wide can perform various works, such as targeted drug delivery, biosensing, tumor clearance, and surgery. Nanodiagnostics uses various nano-biosensors acting as biological recognition elements for detecting various analytes (glucose, antibiotics, toxins, etc.). Robotically coupled nano-micromotors inserted into the blood may be able to sense, detect, and eliminate potential microorganisms, tumor cells, or toxic substances. The nanorobotics and nanodiagnostics are integrated parts of human health and the agroecosystem. Nanorobotic agriculture tools include nonporous platforms, wearable devices, micro-nanoneedle patches, nanoparticle-based sensors, quantum dots, and CRISPR/Cas9-based tools that can precisely sense and eliminate plant pathogens for sustainable agriculture and the food industry. This book, *Nanorobotics and Nanodiagnostics in Integrated Biology and Biomedicine*, is the first volume of the original book series approved by Springer Publishing Ltd. More specifically, this book focuses on the recent developments and significant breakthroughs in nanorobotics and nanodiagnostics based on various nano- or biopolymer materials, Lab-on-a-chip devices, printed nanobots, biomolecule sensors, and advanced stimuli-responsive nanodevices, beneficial for human health and agriculture. The present volume comprises 18 chapters prepared by magnificent authors from Brazil, China, Pakistan, Egypt, India, South Africa, South Korea, Saudi Arabia, and the United States. We hope that a combination of 18 outstanding chapters written by professionals and experts represents an extensive knowledge of nanorobotics and nanodiagnostics techniques. We express our sincere gratitude to all the contributing authors who helped us and made their comments about editing the entire book. Without their excellent skills, extensive efforts, and support, writing this book might not have been possible. We hope that the present volume not only encourages the people working in this field but also inspires young scientists and researchers to enlighten the future nanorobotics and nanodiagnostics skills. Last but not least, we would like to thank Springer Publishers for supporting and helping us throughout the journey. We express our sincere gratitude to the Springer staff, editorial directors
